Health problems rarely occur in isolation or for obvious reasons

Instead of simply guessing at what might be wrong, let us help you discover what is *really* going on inside your body based on the many clues it is giving.

[Click here](#) for an in-depth online health analysis by [The Analyst™](#) with full explanations and recommendations.

Colloidal Silver (CS) is an effective antimicrobial with powerful antibiotic properties that help destroy bacteria, fungi and viruses.

Please note that it is extremely important to obtain an accurate diagnosis before trying to find a cure. Many diseases and conditions share common symptoms: if you treat yourself for the wrong illness or a specific symptom of a complex disease, you may delay legitimate treatment of a serious underlying problem. In other words, the greatest danger in self-treatment may be self-diagnosis. If you do not know what you really have, you can not treat it!

Knowing how difficult it is to weed out misinformation and piece together countless facts in order to see the "big picture", we now provide simple online access to The Analyst™. Used by doctors and patients alike, The Analyst™ is a computerized diagnostic tool that sits on a vast accumulation of knowledge and research. By combining thousands of connections between signs, symptoms, risk factors, conditions and treatments, The Analyst™ will help to build an accurate picture of your current health status, the risks you are running and courses of action (including appropriate lab testing) that should be considered. Full information is available [here](#).

Simply put, colloids are extremely minute particles suspended in water, with a positive electrical charge. The smaller the particles, the more effective they appear to be. Some manufacturers claim a long shelf life, while distributors of units that make CS as needed claim that freshness is important and that solutions weaken with time. There is enough contradictory information available to

maintain a state of confusion regarding CS, its uses, potency and safety, for some time.

CS does not attack [bacteria](#) directly, but rather deactivates enzymes responsible for the multiplication and [metabolism](#) of [anaerobic](#) organisms especially Microbes cannot mutate into silver-resistant forms, as happens with conventional antibiotics. CS acts as a catalyst and is not consumed in the process; it is known to be successful against more than 650 illness-causing microorganisms.

Safety and Toxicity

CS is claimed to be non-toxic, non-addicting, and to have no known side-effects. Unlike silver nitrate, CS can be used safely as a supplement. Drug interactions and allergic reactions are unknown. One review emphasizes the "lack of established effectiveness and potential toxicity of these products." [*"Silver products for medical indications: risk-benefit assessment."* by Fung MC, Bower DL, *J Toxicol Clin Toxicol* 1996;34(1): pp.119-26]

Roger Altman, Eng.Sc.D., in an experimental fashion, consumed 2.34mg of silver daily for several months then measured the total silver excreted from his body over a 24 hour period. He concluded that silver is excreted easily from the body, primarily in the urine.

He also ran a measurement of silver elimination for 100 days following the cessation of silver intake. Initially, most of the silver was eliminated through the urine. He noted that increasing water intake increased silver elimination through the urine. After approximately the first month, silver elimination was greater through the feces than through the urine. He estimated that by the 100 day mark nearly all of the accumulated silver had been eliminated from his tissues.

This may explain why there has been, at the time of writing, just one case of argyria (a permanent blue-gray discoloration of the skin and deep tissues) reported of an individual using low dosage CS. [*"Argyria following the use of dietary supplements containing colloidal silver protein."* by Gulbranson SH, Huc JA, Hansen RC, *Cutis* 2000 Nov;66(5): pp.373-4]

Despite claims of no toxicity, and that it is "impossible" for silver in this form to accumulate in the body, caution is advised when taking *large doses for extended periods of time*. The indiscriminate use of silver solutions (apparently always in a form other than CS) has resulted in cases of argyria. The [FDA](#) has issued a Final Rule declaring that all over-the-counter (OTC) drug products containing colloidal silver or silver salts are not recognized as safe and effective and are misbranded. This ruling came into force on September 16, 1999.

Colloidal Silver should be used temporarily rather than continuously. Some doctors recommend that after using colloidal silver for an extended internal treatment period you should take steps to remove the silver from your system. Approaches include taking homeopathic silver (Argentum nitrate), [EDTA](#) chelation, or homeopathic DMPS.

Concentrations / Dosage

Products have varied in concentration from less than 10ppm to 500ppm. Professional suppliers often offer products in the 25ppm range with a suggested dose of 25 drops (0.75cc) under the tongue 4 times per day. This dose provides about 75mcg (0.075mg; about 13 of these doses equals 1mg.)

A 1ppm concentration is the same as 1mg per [liter](#) - for example 10ppm CS contains 10mg of silver in one liter of liquid; one teaspoon of 10ppm CS contains

50mcg of silver.

Uses

Colloidal silver is commonly recommended in acute and chronic recurrent infections for short term use (7-10 days). When atomized and inhaled through a mister, colloidal silver can be sprayed into the nose or throat as a disinfecting throat gargle.

Claims are made for benefits in the following conditions:

Acne*, allergies, arthritis - some types*, athletes foot*, bad breath, bladder infections, cystitis*, bleeding gums, boils*, burns*, candida*, canker sores, chronic fatigue, colds, colitis*, conjunctivitis*, cornea injury*, cystitis, dandruff, dermatitis, diabetes*, diarrhea*, digestive aid, diphtheria, dysentery, ear infections*, eczema - various locations*, fibrositis, flu*, gastritis, gingivitis, gonorrhea*, gum recession, halitosis, hay fever*, hemorrhoids*, hepatitis, herpes, impetigo*, keratitis, leprosy, lupus, Lyme disease, lymphagitis*, malaria, Menier's disease*, meningitis*, moles, ophthalmology, parvo virus*, pleurisy, pneumonia, prostate enlargement, pruritis - anal and other, psoriasis and skin rashes*, rheumatism, rhinitis*, ringworm*, rosacea, seborrhea, sepsis - infection*, shingles*, sinusitis*, skin cancer, sore throat, staph infections*, strep infections*, syphilis, tonsillitis*, tooth decay delay, toxemia, trench foot, tuberculosis, typhoid, ulcers*, Vincent's angina*, warts*, whooping cough*, yeast infections*.

* Documented uses. There are other uses not contained in this list, and uses listed here may be substantiated but not noted so in this list.

GLOSSARY

Acne

A chronic skin disorder due to inflammation of hair follicles and sebaceous glands (secretion glands in the skin).

Acute

An illness or symptom of sudden onset, which generally has a short duration.

Allergic Rhinitis (Hay Fever)

Inflammation of the nasal mucous membranes that is caused by specific allergen(s). It is an allergy characterized by sneezing, itchy and watery eyes, a runny or stuffy nose, coughing and a burning/scratchy sensation of the palate and throat.

Allergy (Allergies)

Hypersensitivity caused by exposure to a particular antigen (allergen), resulting in an increased reactivity to that antigen on subsequent exposure, sometimes with harmful immunologic consequences.

Anaerobic (Anaerobically)

Of, relating to, or being activity in which the body incurs an oxygen debt (for example weight training or resistive exercises) and does not immediately burn off a lot of calories and fat.

Antimicrobial

Tending to destroy microbes, hinder their multiplication or growth.

Arthritis (Arthritic)

Inflammation of a joint, usually accompanied by pain, swelling, and stiffness, and resulting from infection, trauma, degenerative changes, metabolic disturbances, or other causes. It occurs in various forms, such as bacterial arthritis, osteoarthritis, or rheumatoid arthritis. Osteoarthritis, the most common form, is characterized by a gradual loss of cartilage and often an overgrowth of bone at the joints.

Bacteria (Bacterial, Bacterium)

Microscopic germs. Some bacteria are "harmful" and can cause disease, while other "friendly" bacteria protect the body from harmful invading organisms.

Boil (Abscess, Abscesses, Boils, Carbuncle, Carbuncles, Cystic Acne, Furuncle, Furuncles, Hidradenitis Suppurativa, Pilonidal Cyst, Pilonidal Cysts)

A localized infection deep in the skin. A boil generally starts as a reddened, tender area. Over time, the area becomes firm and hard. Eventually, the center of the abscess softens and becomes filled with white cells that the body sends to fight the infection (pus). Finally, the pus forms a "head" and drains out through the skin. A **furuncle** or **carbuncle** is an abscess in the skin caused by the bacteria *Staphylococcus aureus*. It can have one or more openings onto the skin and may be associated with a fever or chills. **Cystic acne** is a type of abscess formed when oil ducts become clogged and infected. Cystic acne is most common in the teenage years. **Hidradenitis suppurativa** is an illness in which there are multiple abscesses that form under the arm pits and in the groin area. These areas are a result of local inflammation of the sweat glands. A **pilonidal cyst** is a special kind of abscess that occurs in the crease of the buttocks. These frequently form after long trips that involve sitting.

Cancer

Refers to the various types of malignant neoplasms that contain cells growing out of control and invading adjacent tissues, which may metastasize to distant tissues.

Candidiasis (Candida)

Infection of the skin or mucous membrane with any species of candida, usually *Candida albicans*. The infection is usually localized to the skin, nails, mouth, vagina, bronchi, or lungs, but may invade the bloodstream. It is a common inhabitant of the GI tract, only becoming a problem when it multiplies excessively and invades local tissues. Growth is encouraged by a weakened immune system, as in AIDS, or with the prolonged administration of antibiotics. Vaginal **symptoms** include itching in the genital area, pain when urinating, and a thick odorless vaginal discharge. Candidiasis is also known as:

Candida; Candida albicans; Candida Related Complex; Chronic Candida Syndrome; (Chronic) Systemic Candidiasis; Monilia; Candidiasis Hypersensitivity Syndrome; Candidosis; (Chronic) Mucocutaneous Candidosis; Thrush (oral or vaginal); Moniliasis; Polysystematic Candidiasis.

Canker Sores (Aphthous Ulcers)

Small, painful ulcers that occur on the inside of the cheek, lip or underside of the tongue. Caused by an assortment of viruses, doctors call this condition aphthous stomatitis. Canker sores usually clear up by themselves within a week or so, but they often recur, sometimes in the form of multiple sores.

Chronic (Chronicity)

Usually referring to chronic illness: Illness extending over a long period of time.

Chronic Fatigue Syndrome (CFS, Chronic Fatigue)

A disorder of unknown cause that lasts for prolonged periods and causes extreme and debilitating exhaustion as well as a wide range of other symptoms such as fever, headache, muscle ache and joint pain, often resembling flu and other viral infections. Also known as Chronic Fatigue and Immune Dysfunction Syndrome (CFIDS), Chronic Epstein-Barr Virus (CEBV), Myalgic Encephalomyelitis (ME), "Yuppy Flu" and other names, it is frequently misdiagnosed as hypochondria, psychosomatic illness, or depression, because routine medical tests do not detect any problems.

Colitis

Inflammation of the colon.

Cornea

Transparent structure forming the anterior part of the eye.

Deciliter (dL)

0.1 or one tenth of a liter.

Dermatitis

A general term used to refer to eruptions or rashes on the skin.

Diabetes Mellitus (Diabetes, Diabetic, Diabetics)

A disease with increased blood glucose levels due to lack or ineffectiveness of insulin. Diabetes is found in two forms; insulin-dependent diabetes (juvenile-onset) and non-insulin-dependent (adult-onset). **Symptoms** include increased thirst; increased urination; weight loss in spite of increased appetite; fatigue; nausea; vomiting; frequent infections including bladder, vaginal, and skin; blurred vision; impotence in men; bad breath; cessation of menses; diminished skin fullness. Other symptoms include bleeding gums; ear noise/buzzing; diarrhea; depression; confusion.

Diarrhea

Excessive discharge of contents of bowel.

Eczema

Swelling of the outer skin of unknown cause. In the early stage it may be itchy, red, have small blisters, and be swollen, and weeping. Later it becomes crusted, scaly, and thickened.

EDTA

Ethylene Diamine Tetraacetic Acid. An organic molecule used in chelation therapy.

FDA

The (American) Food and Drug Administration. It is the official government agency that is responsible for ensuring that what we put into our bodies - particularly food and drugs - is safe and effective.

Gonorrhea

A sexually-transmitted disease that is often without symptoms. If there are symptoms in the female, they include frequent and painful urination, cloudy vaginal discharge, vaginal itching, inflammation of the pelvic area, and abnormal uterine bleeding. If the male has a purulent (pus-like) urethral discharge, he should assume he has gonorrhea until proven otherwise.

Hemorrhoids

Varicose disorder causing painful swellings at the anus; piles.

Hepatitis

Inflammation of the liver usually resulting in jaundice (yellowing of the skin), loss of appetite, stomach discomfort, abnormal liver function, clay-colored stools, and dark urine. May be caused by a bacterial or viral infection, parasitic infestation, alcohol, drugs, toxins or transfusion of incompatible blood. Can be life-threatening. Severe hepatitis may lead to cirrhosis and chronic liver dysfunction.

Liter (Liters, Litre, Litres)

A metric measure of volume equivalent to 1.057 liquid quarts or 0.2642 gallons.

Metabolism (Metabolic, Metabolize, Metabolizes, Metabolizing)

The chemical processes of living cells in which energy is produced in order to replace and repair tissues and maintain a healthy body. Responsible for the production of energy, biosynthesis of important substances, and degradation of various compounds.

Mole (Moles, Nevi, Nevus)

Known more accurately as a "nevus", a mole is a lesion of the skin that may be present from birth, but which most often appears later in life. By three years of age, 40% of children will have at least one nevus. Some varieties are hereditary and most have color. A common nevus in light-skinned people is typically small, round, tan or brown, with a smooth border, and exactly the same throughout. Other types may be very large, or have irregular borders. There are dozens of different types, with many shapes, colors and sizes. While most are benign, malignant changes can occur to turn the benign nevus into a melanoma.

ppm

Parts Per Million. A measure of the concentration of a substance, usually in air or water.

Psoriasis

An inherited skin disorder in which there are red patches with thick, dry silvery scales. It is caused by the body making too-many skin cells. Sores may be anywhere on the body but are more common on the arms, scalp, ears, and the pubic area. A swelling of small joints may go along with the skin disease.

Rhinitis

Inflammation of the nasal mucous membrane.

Shingles (Herpes Zoster)

A severe infection caused by the Varicella-Zoster virus (VZV), affecting mainly adults. It causes painful skin blisters that follow the underlying route of brain or spinal nerves infected by the virus. Also know as herpes zoster.

Syphilis

A sexually-transmitted disease, with symptoms in the early contagious stages being a sore on the genitalia, a rash, patches of flaking tissue, fever, a sore throat, and sores in the mouth or anus.

Ulcer (Ulceration, Ulcers)

Lesion on the skin or mucous membrane.

Virus (Viri, Viruses)

Any of a vast group of minute structures composed of a protein coat and a core of DNA and/or RNA that reproduces in the cells of the infected host. Capable of infecting all animals and plants, causing devastating disease in immunocompromised individuals. Viruses are not affected by antibiotics, and are completely dependent upon the cells of the infected host for the ability to reproduce.

Yeast

A single-cell organism that may cause infection in the mouth, vagina, gastrointestinal tract, and any or all bodily parts. Common yeast infections include candidiasis and thrush.
