What can I say; here we go again!

I hardly need to go down the [list of lies used to start US wars](#). We have been though that over and over again.

Nor do I need to elucidate on the many reasons why the US Government is in desperate need for yet another war with which to scare the American people into acceptance of more takes and fewer rights and freedoms.

Anyone with half a brain realizes that the US Government, unable to gain support for an invasion of Iran, has changed gears and decided that North Korea will be the next step towards World War III.

Here is the big lie...

Let us start with a [cloned copy of the official South Korean website detailing the sinking of the Cheosan](#).

From that website we get the following picture of the remains of a torpedo dredged from the bottom of the ocean.

□ 수거 및 채증 과정 Recovery & collection

The official claim that North Korea fired this torpedo at a South Korean warship is based on the following blueprint of a North Korean torpedo claimed to be the weapon recovered from the ocean floor.

There are several differences between the torpedo plans and the actual torpedo recovered from the floor of the ocean. But I am going to focus on just one.

Take a close look where the tail cone assembly (indicated by the bulkhead at the leading edge of the fins) attaches to the torpedo main hull. A major component of all modern torpedoes are the fin actuators. These are the small motors that adjust the rudder and dive planes of the torpedo in order to maintain the intended depth and course to target.

Note that the blueprints of the North Korean torpedo show these actuators forward of the tail cone assembly, that is to say in front of the bulkhead that marks where the fin assembly attaches to the torpedo.

Now let us look at the torpedo actually recovered from the bottom of the ocean near where the Cheosan was attacked.

## □ 수거 및 채증 과정 Recovery & collection

Note that the recovered torpedo these actuators are built INSIDE the tail cone assembly, that is to say to the REAR of the bulkhead that marks where the fin assembly attaches to the torpedo.

## □ 수거 및 채증 과정 Recovery & collection

And again, as seen in the official released photo of the recovered torpedo.

In short, the torpedo recovered from the ocean where Cheosan was attacked is NOT the same torpedo shown in the North Korean plans. As I stated above, there are additional differences as well between the blueprints and the actual torpedo, but the actuators are the clincher.

The torpedo recovered from the ocean where the Cheonan was sunk is not the North Korean torpedo shown in the blueprints.
