Kindra Arnesen Suffering From Gulf Disaster, “Natural Barrier of Our Skin is Gone”

Alex Thomas

We have heavily documented the sickness that has been caused by BP and their use of the toxic dispersant known as Corexit. We have produced [photographs](#), eye witness accounts[[See the June/July archives of our radio show](#)], and [multiple blood tests](#). The problem is that every time we receive more evidence it doesn't indicate that the crisis is beginning to get better, rather it indicates that it is much worse.

Kindra Arnesen has battled BP and their toxic spraying from the [beginning](#) and has been a ray of hope for all. She has helped to expose the many cover ups perpetrated by BP and their puppets within the American government.

Last week, a radio broadcast by The Coastal Heritage Society of Louisiana, complete with a radio host broadcasting live from the hospital, created a tremendous uproar throughout the internet. [Florida Oil Spill Law](#) posted the [audio](#) which was subsequently picked up The Intel Hub and Rense.com as well as many others. The audio indicated that all the members of the CHSL radio show were sickened, with health problems ranging from a staph infection to neurotoxin poisoning.

Naturally the radio broadcast left many unanswered questions and Project Gulf Impact has attempted to answer at least some of them. Gulf Impact has worked diligently to expose the disaster and this video is one of the most important they have ever produced.

This video really speaks for itself. Kindra, along with many other gulf coast residents have had their natural skin barrier **DESTROYED**.

Doctors in the area will not deal with these clear medical problems. Have they been bribed or do they simply not want to put their livelihood on the line for the sake of someone else's health? Some have tried to help while others have seemingly misdiagnosed people on purpose.

"THEY ARE STILL SPRAYING!!!...."

YOU CAN'T LIVE LIFE LIKE YOU WOULD NORMALLY, EVERYTHING IS AROUND THE OIL SPILL.....

NEXT THING YOU KNOW YOU HAVE SOME SORT OF BACTERIAL INFECTION."

Who would allow such a sickening chemical to be used so close to the human population? Why are the people of the gulf being used as guinea pigs in an experiment sanctioned by elements of our own government?

Please Spread this article to everyone you know. This is extremely important information. The Gulf disaster is NOT over, in fact, the actual spraying of Corexit hasn't even stopped.

From the looks of that raw infection on her hip, she has serious problems...

Epsom salt (two or three whole cartons of it at a time), and a whole carton of baking soda is what she should be doing (it wouldn't get that big)..

I've seen something similar in Oregon in 2006 that was causing the skin to begin to turn as red as the surrounding tissue is on her hip.. You have to fully shock the skin at least 4 times with as hot a water as you can stand to open the pores up, and drip dry (like she said she is doing)..

But she's defeating the purpose of the bath by using peroxide and alcohol, and covering up the wound without allowing it to scab up (scabs close wounds, and protect the skin from further damage, after it dries and scabs, then she can cover it up..

These people are in deep trouble, in Oregon, where the trouble was in 2006, the local Indians called the valley where the town is located at "The Valley Of Death".. I tend to agree with them because it nearly got to me as well..

This Corexit is nothing more than a soft kill bio-weapon, by destroying the red blood cells, people become anemic, incapable of getting enough oxygen, results in lethargy, an overloaded liver processing toxins at a rate that is overwhelming the liver itself (bet most of the people have a larger liver now which is the process of toxic overload)

I am pissed about this, I have family in Houston, these people need a level 4 bio-suit with self contained oxygen system just to live there now..

I think all politicians state, federal, and local, need to be located right near the ocean and told "you will never leave here, after all you say there is nothing wrong right?"

I have worked around this stuff most of my adult life. Corexit can cause respiratory problems, kidney problems,(including a pink tinge to your urine) and Xylene can cause your testicles to shrivel. It is not stuff to fool around with, but is not likely to kill you in low concentrations.

More bullshit, both pro and con, has been disseminated about Corexit than anything I can recall.

Someone from BP said it was safer than dish soap. Then how come you are supposed to avoid contact with your skin and not breathe the vapors?

On the other hand, after working in a lab on and off for a couple of years, I always had a liver function test run whenever I got a physical. Full disclosure here; I worked for Exxon, and they paid for a physical every two years, along with a hearing test. Your hearing or kidney function can obviously go bad even without contact with chemicals (I'm thinking motorcycles and alcohol here) but it does give you an idea if you are developing a problem.

I'm retired and in my sixties now, have about average hearing, normal liver function, and a kind of low grade, chronic skin problem that doctors not affiliated with Exxon tell me is common amongs people who have dirty, sweaty jobs, or are exposed to irritants.

To people in the Gulf, who may have been downwind of more than just the recent overtreatment of Corexit 9500, it wouldn't hurt to get yourself checked, but I think it's a little hysterical to think about evacuating the the southeastern coast just yet. I would be more worried about what is getting into ground water as a result of this, and the big push to increase natural gas production by use of rock fracturing procedures that use chemicals that make 9500 look like soda pop. Note; if your tap water catches fire, it's probably not safe to drink. Let's make sure we keep our paranoia pointed in the right direction.

James if the contamination is ongoing, has been ongoing, and is in the water table and air for several years to come how do you think she is going to "get better"?

David you said you've "worked around this stuff for years" but never once mentioned what happens when one is poisoned by high doses of BENZENE on an ongoing basis.

Even the government said that the cap wasn't "officially sealed" until September. March to September of every day exposure? 24 hour a day dermal/ingested/inhaled exposure?

Sounds like someone is trying to do a bit of work for BP. Save it.
