Maine Gov NWO Agent For Rockefeller Eugenics Program

9-9-9

Editor's Note: Carefully read this propaganda "cover" story and realize the bill of goods that is being sold here:

1. "The emergency designation protects schools and health care providers against liability claims"

1B. "The emergency proclamation allows for those clinicians, once their credentials have been approved, to become temporary employees of the state, relieving provider agencies from the administrative burden and legal liabilities associated with hiring them directly."

1C. "And while vaccine manufacturers are generally not liable for ill effects of the vaccines they produce, Mills said, the federal government does have a compensation fund for vaccine-related illnesses or injuries."

2. "officials in Maine are encouraging public schools to offer on-site immunization clinics for all children, including infants over 6 months and preschoolers as well as children who are home-schooled. "

3. "that many schools will partner with area health care providers such as hospitals, visiting nursing organizations, and health clinics for the actual administration of the injectable vaccines"

4. Dr. Dora Ann Mills, Dir. Maine Center for Disease Control and Prevention

A) "The H1N1 vaccine is being manufactured using the identical process as the seasonal vaccine," she added. "There is no reason to think it is any less safe than the seasonal vaccine."

B) "Schools are no more liable for injuries associated with the vaccine clinics than they would be for injuries incurred at a basketball game or other community event"

I can only hope that the people in Maine are not so dim witted that they fail to understand the gravity of treachery and TREASON that is being thrust upon them and the participation of the 3 individuals identified in this article-including the writer- within that conspiracy, to falsify and conceal the true dangers associated with the so-called Swine flu vaccination and the PATENTED Swine Flu "virus" that was created in government military labs to create the pretext for a hoaxed Swine Flu 'Pandemic'. It's long over due for ordinary citizens to TAKE ACTION against those who are participating in this Rockefeller-created conspiracy to deprive Americans of their liberty and health -and future. TAKE ACTION, ORGANIZE and RESIST. -- Ken Adachi

Maine Gov. Baldacci Latest NWO Sell-out to Join Rockefeller Eugenics Program (Sep. 2, 2009)

Original title: Gov. Baldacci proclaims civil emergency due to H1N1

<http://www.bangordailynews.com/detail/118627.html>

AUGUSTA, Maine - Gov. John Baldacci on Tuesday declared a statewide civil emergency because of the H1N1 influenza virus, paving the way for mass immunization of Maine schoolchildren and other residents.

The emergency designation protects schools and health care providers against liability claims related to their participation in school-based vaccine clinics this fall for both the seasonal flu and the H1N1 flu. "Maine has been proactive in its response to this new flu," Baldacci said in announcing the proclamation. "But as the school year begins, we must continue our vigilance, which will require a responsible and aggressive vaccination and public education campaign. It's our goal that every person in the state has access to vaccines for the seasonal and H1N1 flu."

Today's Poll

Do you think Maine school children should be vaccinated against swine flu?

Yes

No

View results

In accordance with recommendations from the U.S. Centers for Disease Control and Prevention, officials in Maine are encouraging public schools to offer on-site immunization clinics for all children, including infants over 6 months and preschoolers as well as children who are home-schooled. Participating schools will offer the seasonal influenza vaccine as soon as possible, and many also will offer the new H1N1 vaccine when it becomes available.

A list of participating schools is not yet available. Dr. Dora Anne Mills, director of the Maine Center for Disease Control and Prevention, said Tuesday that many schools will partner with area health care providers such as hospitals, visiting nursing organizations, and health clinics for the actual administration of the injectable vaccines. But those providers may not have enough clinical staff to devote to giving the vaccines and will be looking to recruit recently retired nurses and other clinicians who are not their regular employees.

The emergency proclamation allows for those clinicians, once their credentials have been approved, to become temporary employees of the state, relieving provider agencies from the administrative burden and legal liabilities associated with hiring them directly.

Mills said a similar process was employed in the aftermath of Hurricane Katrina and Hurricane Rita when Maine nurses and other providers worked with rescue and recovery teams on the Gulf Coast.

Schools are no more liable for injuries associated with the vaccine clinics than they would be for injuries incurred at a basketball game or other community event, Mills said. And while vaccine manufacturers are generally not liable for ill effects of the vaccines they produce, Mills said, the federal government does have a compensation fund for vaccine-related illnesses or injuries.

"The H1N1 vaccine is being manufactured using the identical process as the seasonal vaccine," she added. "There is no reason to think it is any less safe than the seasonal vaccine."

Hundreds of cases of H1N1 have been confirmed in Maine, with many times that number of cases presumed. The virus is linked to one death in Maine. Although symptoms in this country have been relatively mild in most cases, public health officials predict a surge in the number of cases and possibly in the severity of the symptoms beginning this fall.

Unlike the seasonal flu, H1N1 thus far has proved to be more dangerous to young people, including children, teens, pregnant women and young adults. School-age children, in particular, are seen as a primary source of transmission to other vulnerable populations. Public health officials advise these groups to be vaccinated against the seasonal flu to help maintain their general good health, and to get the H1N1 vaccine as soon as it becomes available.
